To Whom It May Concern:

In February 2016 I installed WTS Water Enhancement Technology (WTS) Unit into the water system of my dairy, What I noticed was that my heifers were gaining significantly more height and weight than they typically have at their age. The representative Of WTS Associate explained that the heifers were realizing more of the nutritional value in their food, by 30 + % more nutritional, just as he had told me they would from the beginning. This allowed me to reduce the energy in the rations that I have been feeding, while still maintaining good weight gains, according to my nutritionist, he notes that my cows have an improved and maintained body condition.

I have also installed a WTS Unit in the watering system of my 100-acre crop of foliage. The first indication of a benefit was the changes in my soil. We took a soils sample prior to the use of WTS Water, then, on our normal watering schedule we flood irrigated 4 times with WTS water and then took another soils analysis, noting the very significant reductions in salts, hard minerals and nitrates from the soil, as well as some other beneficial shifts in the makeup of my soil. See attached soils analysis reports, Prior to the use of WTS water, my crop was salt and nitrogen burnt with sparse development. The use of WTS Water has reduced the nitrate and sodium levels to significantly more manageable ranges and the proof is evident in the health of my crop.

I highly recommend the WTS Unit to the Dairyman and Farmer to help manage toxic levels of salts, hard minerals and nitrates. As well as a better value in the feed and rations we feed our cows. I have seen nothing but improvements since using the treated water.

Sincerely,

Carl Souza
